Leandro Raul **Iannotti**

Lead / Staff-leaning Software Engineer · Distributed Systems · AI-Augmented Engineering

+64 21 0709644 | leandro.iannotti@gmail.com | leandro-iannotti

Summary

Lead / Staff-leaning Software Engineer with 10+ years of experience designing, evolving, and operating distributed systems, integration-heavy platforms, and cloud-based product applications. Strong background in backend engineering, event-driven architecture, system decomposition, technical mentoring, and cross-functional delivery across product, engineering, support, and business stakeholders.

Known for turning ambiguous technical and product problems into pragmatic architecture, implementation plans, and delivery paths. Experienced in guiding engineering decisions around service boundaries, reliability, maintainability, integration design, and operational risk while staying close to hands-on delivery.

Brings a modern AI-augmented engineering approach, using supervised multi-model workflows, structured agent execution, and controlled automation to improve technical discovery, implementation quality, debugging, documentation, refactoring, and delivery speed while maintaining strong human review, engineering judgment, and operational safety.

Technical Skills

Technical Leadership	Technical Mentoring, Code Review, Engineering Standards, Technical Decomposition, Architecture Discussions, Interviewing
Systems Architecture	Distributed Systems, Event-Driven Architecture, Microservices, Service Boundaries, Domain-Driven Design, System Design
Backend Platforms	Node.js, TypeScript, Express, REST APIs, Integration Design, API Design, Asynchronous Processing, Backend Services
Product Engineering	Cross-functional Collaboration, Stakeholder Management, Requirements Clarification, Technical Feasibility, Delivery Planning
Cloud & Infrastructure	AWS, Google Cloud Platform, Docker, Kubernetes, GitHub Actions, Jenkins, Azure DevOps
AI-Augmented Engineering	Claude Code, OpenCode, OpenAI, Gemini, GitHub Copilot, MCP Integrations, Multi-Model Workflows, Supervised Agent Execution
Languages	TypeScript, JavaScript, Python, Dart, Java, C#
Messaging & Event Systems	RabbitMQ, Apache Kafka
Databases & Data	MongoDB, PostgreSQL, MySQL, Amazon RDS, DynamoDB, Snowflake
Monitoring & Observability	Datadog

Selected Leadership & Architecture Highlights

- Helped guide a platform evolution from monolithic patterns toward modular services and event-driven workflows, contributing to service boundary discussions, asynchronous processing design, and operational risk evaluation.
- Designed shared backend abstractions and internal platform libraries to improve consistency, reduce duplication, and support more maintainable service development across teams.
- Provided informal technical leadership through mentoring, code reviews, pair debugging, architecture discussions, technical interviews, and implementation guidance.
- Regularly partnered with product, support, and business stakeholders to clarify ambiguous requirements, evaluate trade-offs, and shape pragmatic delivery plans.
- Applied supervised AI-augmented engineering workflows to accelerate technical discovery, implementation, debugging, refactoring, documentation, and review while preserving human judgment and delivery accountability.

Professional Experience

Renti
Auckland, New Zealand

Senior Software Developer — *Mar 2023 – Present*

- Acted as a high-leverage technical contributor across backend architecture, delivery planning, code reviews, debugging, mentoring, and technical decision-making for product-critical initiatives.
- Helped guide the evolution of the platform from monolithic patterns toward a more modular, service-oriented, and event-driven architecture, improving maintainability, resilience, and long-term product flexibility.
- Contributed to architectural decisions around service boundaries, asynchronous workflows, reliability, maintainability, integration design, and operational risk.
- Designed and implemented distributed backend workflows using RabbitMQ and Apache Kafka, supporting asynchronous communication patterns across internal services and product workflows.
- Designed internal platform libraries and shared abstractions to standardize schemas, interfaces, repository patterns, and service conventions across teams, reducing duplication and improving engineering consistency.
- Owned and evolved integration-heavy backend services connecting internal systems, third-party platforms, OAuth/SSO providers, Google and Microsoft ecosystems, and customer-facing product experiences.
- Led the development of a tenant mobile application using Flutter, establishing Clean Architecture foundations, implementation standards, and maintainable development practices.
- Partnered with product, support, and business stakeholders to clarify ambiguous requirements, evaluate technical feasibility, identify trade-offs, and shape pragmatic delivery plans.
- Provided technical mentoring through code reviews, pair debugging, implementation guidance, architectural feedback, and participation in technical interviews.
- Applied structured AI-augmented engineering workflows across technical discovery, specification, planning, implementation, debugging, refactoring, code review, and documentation while maintaining human oversight and engineering accountability.

Sandfield Associates
Auckland, New Zealand

Solution Developer — *Feb 2019 – Mar 2023*

- Delivered backend APIs, web applications, integrations, and mobile solutions for logistics and supply chain platforms used by major companies such as Mainfreight.
- Co-led the development of a supply chain product used by major logistics firms in Australia, contributing across backend architecture, integrations, product requirements, and technical delivery.
- Designed and implemented third-party software and hardware integrations connecting logistics platforms with external systems, operational workflows, and field processes.
- Provided informal technical leadership for small developer teams through mentoring, code reviews, pair debugging, implementation guidance, and delivery support.
- Worked closely with product, client-facing, and business stakeholders to translate complex operational requirements into practical, maintainable software solutions.
- Introduced scalable design patterns, review practices, and implementation conventions focused on maintainability, consistency, and long-term product evolution.

Infor Global Solutions
Buenos Aires, Argentina

Technical Consultant — *Dec 2015 – Aug 2018*

- Delivered enterprise logistics and asset management customizations across integrations, data workflows, reporting, and operational processes.
- Partnered directly with clients to clarify requirements, constraints, technical options, and delivery trade-offs.
- Designed external system integrations, supported SQL Server-based workflows, and coordinated technical rollout details across client and internal teams.

GeoSystems S.A.
Buenos Aires, Argentina

.NET Programmer — *Jan 2012 – Dec 2015*

- Developed web, desktop, mobile, and GIS applications for municipal, cadastral, logistics, and field operations use cases.
- Built systems integrating spatial tools such as AutoCAD and MapGuide with operational software workflows and data-heavy backend applications.
- Maintained Oracle databases and supported applications used across public-sector environments.

Education

University of Buenos Aires
Buenos Aires, Argentina

Bachelor of Computer Science — *2008 – 2018*

National Technology University
Buenos Aires, Argentina

Big Data Introduction – Big Data with Apache tools — *2016 – 2018*

Additional Interests

Interested in systems thinking, natural sciences, physics, creative technology, storytelling, and AI-assisted software and creative workflows.
